

Challenge 2 - Monitoring and Performance on Azure SQL Managed Instance

[Previous Challenge Solution](#) - [Home](#) - [Next Challenge Solution](#)

Goal

The goal of this exercise is to understand monitoring and performance optimization on an Azure SQL Managed Instance.

Actions

- Identifying performance issues, their root causes and fixing the problem
- Use the Azure Portal to identify performance bottlenecks
- Using Log Analytics with KQL to visualize Azure SQL MI and database stats
- Use Github Copilot to identify and mitigate performance issues on your Azure SQL MI

Success criteria

- You have identified the most consuming stored procedure based on the total_worker_time (CPU)
- You successfully reviewed the performance graph showing CPU utilization in the Azure Portal
- You have successfully queried the AzureDiagnostics using KQL to receive the different diagnostics
- You have successfully leveraged Github Copilot to identify and mitigate the most important performance issues on your Azure SQL MI
