

Typology Casebook and Detection Scenario Library

Narrative laundering typologies with the observable data features an automated risk analyser can test

Document ID	GLB-TYP-015
Document type	Typology reference
Jurisdiction code	GLOBAL
Applies to corridors	All
Issuing body (simulated)	Financial Crime Analytics Centre (simulated)
Version / effective date	v1.3 - February 2026
Modelled on public sources	Public FATF and Egmont Group typology literature; all cases below are fictional
Classification	SYNTHETIC - HACKATHON TRAINING DATA

This document is synthetic content authored for a multi-agent fraud intelligence hackathon. It paraphrases the structure and themes of public materials (Public FATF and Egmont Group typology literature; all cases below are fictional) but contains no verbatim reproduction of them. Thresholds, codes and identifiers are illustrative.

1. How to use this casebook

Each typology is expressed as: narrative, observable features, detection scenario in pseudo-rule form, and the corroborating policy reference. Agents should map a candidate account pair to one or more typologies and cite the policy document that governs the corridor.

2. Placement typologies

2.1 Structuring / smurfing

Narrative: proceeds are broken into small cash deposits made by several individuals across branches and ATMs, then consolidated into one account and wired abroad.

- Observable: count of cash credits in 10 days ≥ 6 ; each credit between 70% and 99% of the local reporting threshold; distinct deposit locations ≥ 3 ; consolidation ratio > 0.8 .
- Scenario: $\text{SUM}(\text{cash_in}, 10\text{d}) > \text{threshold}$ AND $\text{MAX}(\text{single_cash_in}) < \text{threshold}$ AND $\text{COUNT}(\text{distinct_location}) \geq 3 \rightarrow \text{alert HIGH}$.
- Policy reference: US-REG-009 section 3; ES-REG-006 section 4; DE-REG-007 section 2.

2.2 Funnel and mule accounts

- Observable: inbound counterparties in 30 days ≥ 8 with no prior relationship; median holding time < 6 hours; outbound concentration to ≤ 2 beneficiaries; account age < 180 days.
- Scenario: $\text{distinct_originators} \geq 8$ AND $\text{avg_hold_time} < 6\text{h}$ AND $\text{outbound_HHI} > 0.6 \rightarrow \text{alert HIGH}$, tag MULE.
- Policy reference: GB-REG-008 section 4; NG-REG-013 section 3.

3. Layering typologies

3.1 Chain transfer through shell entities

- Observable: path length ≥ 3 legal entities; each entity incorporated < 12 months; shared registered address or director; value retention per hop between 97% and 100%.
- Scenario: graph path where each node is a company with age $< 365d$ AND shared_attribute(address|director|agent) -> alert HIGH, tag SHELL_CHAIN.
- Policy reference: PA-REG-014 section 3; GB-REG-008 section 3; OPS-KYC-004 section 3.

3.2 Round tripping

- Observable: outbound to jurisdiction X followed by inbound from jurisdiction Y within 45 days, recovering 55% to 95% of the original value, with the same beneficial owner on both legs.
- Scenario: cycle detected in the counterparty graph AND same_ubo(start,end) AND recovery_ratio in [0.55, 0.95] -> alert HIGH.
- Policy reference: OPS-GEO-005 section 3; GLB-STD-001 section 6.1.

3.3 Correspondent nesting abuse

- Observable: payments through a respondent institution where the ordering customer is itself a financial institution not disclosed at onboarding.
- Scenario: sender_type = FI AND sender NOT IN disclosed_downstream_list -> alert HIGH, tag NESTED.
- Policy reference: GLB-CBK-003 sections 2 and 3.

4. Integration typologies

4.1 Trade-based integration

- Observable: invoice unit price deviation $> 30\%$ from reference; commodity outside the licensed activity; free zone counterparty; documentary credit amended more than twice.
- Scenario: price_deviation > 0.3 OR commodity NOT IN licensed_activities -> alert HIGH, tag TBML.
- Policy reference: AE-REG-011 section 3; BD-REG-017 section 3.

4.3 Informal value transfer substitution

- Observable: a corridor with high expected remittance volume shows a collapse in formal inbound transfers while domestic disbursements to the same beneficiary population continue; or a single domestic account funds many unrelated beneficiaries shortly after an offshore counterpart receives a matching aggregate.
- Scenario: domestic_payout_count ≥ 15 in 7d AND no_matching_inbound_formal_transfer AND payout_beneficiaries_unrelated -> alert HIGH, tag IVTS.
- Policy reference: BD-REG-017 section 4; AE-REG-011 section 2; NG-REG-013 section 3.

4.4 High-value stone and precious metal settlement

- Observable: successive dealer-to-dealer settlements with margin below 2%, no evidenced physical movement or vaulting, and counterparties clustered in one trading centre.
- Scenario: dealer_chain_length ≥ 3 AND margin < 0.02 AND no_logistics_evidence -> alert HIGH, tag STONES.
- Policy reference: IL-REG-016 section 3; BE-REG-018 section 3; AE-REG-011 section 2; DE-REG-007 section 2.

4.5 Capital control and foreign exchange quota circumvention

- Observable: an outbound cross-border transfer is decomposed across several related individuals, each remitting an amount at or just below a personal annual foreign exchange facility, with the funds reconverging on one foreign beneficiary within 30 days.
- Scenario: `distinct_senders >= 4 AND shared_attribute(address|device|funding_account) AND single_foreign_beneficiary AND per_sender_amount near annual_facility -> alert HIGH, tag FX_SMURFING.`
- Policy reference: CN-REG-019 sections 3 and 4; BD-REG-017 section 2; GLB-STD-001 section 6.

4.2 Real estate and high-value goods

- Observable: property settled by multiple unrelated payers; part settlement in cash or virtual assets; resale within 12 months at a materially different price.
- Scenario: `distinct_payers >= 3 FOR single_asset OR cash_component > local_cash_limit -> alert HIGH.`
- Policy reference: ES-REG-006 section 5; DE-REG-007 section 5; MX-REG-012 section 4.

5. Scoring guidance for the risk analyser agent

Evidence combination	Suggested risk	Required output
One typology feature only	LOW	Log, no case
Two features from the same typology	MEDIUM	Create case, request customer context
Two typologies co-occurring, or one typology plus HIGH corridor	HIGH	Create case, cite both policy documents, propose restriction
Any prohibited corridor, sanctions nexus, or confirmed shell chain	CRITICAL	Immediate escalation, propose block and report

Every generated assessment must cite at least one policy document identifier and the specific section, so that the finding is auditable. An assessment without a citation shall be treated as unsupported and returned for rework.
