

Challenge 3 - Security on Azure SQL Managed Instance

[Previous Challenge Solution](#) - [Home](#) - [Next Challenge Solution](#)

Goal

The goal of this exercise is to understand the layered security model available when running databases in Azure.

Actions

- Perform data discovery & classification as a built-in capability for discovering, classifying, labelling and protecting sensitive data in databases
- Review the Azure Defender for SQL – Vulnerability Assessment
- Azure Defender for SQL – Advanced Threat Protection
- Use Github Copilot to identify and mitigate security issues on your Azure SQL MI

Success criteria

- You have successfully created data classification recommendations and added custom data classification
- You successfully used Vulnerability Assessment to generate the initial vulnerability scan baseline
- You have successfully reviewed Advanced Threat Protection and created a security alerts on an anomalous activity.
- You have successfully leveraged Github Copilot to identify and mitigate the most important security issues on your Azure SQL MI
